# Conflict of interest disclosure

- In the past 5 years, M.C.E. has received grant support from **Astellas Pharma, bioMerieux, Gilead Sciences, Merck Sharp and Dohme, Pfizer, Schering Plough, Soria Melguizo SA,**
- He has been an advisor/consultant to the **Panamerican Health Organization, Astellas Pharma, Gilead Sciences, Merck Sharp and Dohme, Pfizer, and Schering Plough.**
- He has been paid for talks on behalf of **Gilead Sciences, Merck Sharp and Dohme, Pfizer, Astellas Pharma and Schering Plough.**

# Rationale of Recommendations by Quality of Evidence for Diagnostic Module. BIOMARKERS ONLY

| <u>Accuracy</u>                     |  |
|-------------------------------------|--|
| Highly recommended                  | Technique is accurate in >70% of cases (most)  |
| Recommended                         | Technique accurate in 50 – 70% of cases (reasonable number)  |
| Not Recommended                     | Technique accurate in <50% of cases (small number)   |
| No recommendation                   | No data  |
| <u>Quality of evidence accepted</u> |  |
| Level I                             | Evidence from at least 1 properly designed prospective <b>multicentre</b> cross-sectional or cohort study  |
| Level II                            | Evidence from<br>(1) at least 1 well-designed prospective single-centre cross-sectional or cohort study<br>or (2) a properly designed retrospective <b>multicentre</b> cross-sectional or cohort study<br>or (3) from case-control studies |
| Level III                           | Opinions of respected authorities, clinical experience, descriptive case studies, or reports of expert committees  |

# Rationale of Recommendations by Quality of Evidence for Diagnostic Module. BIOMARKERS ONLY

| <u>Accuracy</u>                     | $\text{accuracy} = \frac{\text{number of true positives} + \text{number of true negatives}}{\text{numbers of true positives} + \text{false positives} + \text{false negatives} + \text{true negatives}}$                                   |
|-------------------------------------|--|

## SUMMARY: Blood culture

Number: 3 (2 to 4)

Timing: Obtain blood cultures, one right after the other, from different sites

Site: direct puncture of the vein

Volume: Children <2kg, 2 to 4 mL, between 2 and 12 kg, 6 mL, between 12 and 36, 20 mL. At least 60 mL for adults

Frequency: Daily when candidaemia is suspected

Incubation time: At least five days

Performance: 50-75% S (neutropenic, species)

ID is mandatory (yeast in BC is not always *Candida*). Lysis-centrifugation (if older BC systems are used)

## Diagnostic Performance of the (1→3)- $\beta$ -D-Glucan Assay for Invasive Fungal Disease

Sophia Koo,<sup>1,2,3</sup> Julie M. Bryar,<sup>1,4</sup> John H. Page,<sup>4</sup> Lindsey R. Baden,<sup>1,2,3</sup> and Francisco M. Marty<sup>1,2,3</sup>

<sup>1</sup>Brigham and Women's Hospital, <sup>2</sup>Dana-Farber Cancer Institute, <sup>3</sup>Harvard Medical School, and <sup>4</sup>Harvard School of Public Health, Boston, Massachusetts

Clinical Infectious Diseases 2009;49:1650-9

**A total of 1308 BG assays were performed for 871 patients. 228 proven or probable IFD**

**Sensitivity 64%, specificity 84%. Positive likelihood ratio was 3.93 and the negative likelihood ratio was 0.43**

**FP: Albumin, intravenous immunoglobulin, and hemodialysis  
Empirical systemic antifungal treatment did not reduce overall BG sensitivity.**

**Sensitivity was slightly lower among patients with hematologic malignancy or stem cell transplantation**

Koo et al. CID 2009

# What are the best tests for diagnosing invasive candidiasis?

## SUMMARY of tissue samples and body fluids

### Microscopic Examination:

Obtained and collected aseptically

Transport to the lab promptly

Tissue for histopathology should be placed in fixative rapidly

Special stains should be use including optical brighteners, silver stains and PAS

Morphology cannot be used for definitive ID. Expertise needed for interpretation

### Culture:

Use selective media

Yeast isolation from normally sterile tissues or fluids is usually indicative of deep seated infection

Negative culture results do not exclude *Candida* infection. Blood cultures have low diagnostic yield

Identification is mandatory

# What are the best tests for diagnosing invasive candidiasis?

## SUMMARY of other techniques

### Immunohistochemistry

Not generally available, use specific antibody commercially available

### Tissue PCR

Not commercially available. No third party validation

### In situ hybridization

Not commercially available. No third party validation

### Mannan and Anti-Mannan in serum

No data

### $\beta$ -D-Glucan in serum

RECOMMENDED, same than those in candidaemia

### Septifast and in-house PCR in serum

No data

# TDM Recommendations

**TDM: therapeutic drug monitoring**

## Are therapeutic drug monitoring (TDM) indicated for patient management? 1

- TDM must be used for patients treated with 5-fluorocytosine
- **TDM is not normally required for drugs used in the treatment of *Candida* infections** (ECMO (extra-corporeal membrane oxygenation) can reduce echinocandin concentration)
- TDM is recommended if voriconazole is prescribed (voriconazole TDM is highly recommended in unsatisfactory response to therapy, suspicion of toxicity or drug interaction(s), impaired liver or renal function and in patients on extracorporeal membrane oxygenation)

## Are therapeutic drug monitoring (TDM) indicated for patient management? 1

- TDM must be used for patients treated with 5-fluorocytosine
- TDM is not normally required for drugs used in the treatment of *Candida* infections (ECMO can reduce echinocandin concentration)
- TDM is recommended if voriconazole is prescribed (voriconazole TDM is highly recommended in unsatisfactory response to therapy, suspicion of toxicity or drug interaction(s), impaired liver or renal function and in patients on extracorporeal membrane oxygenation)
