Summary
The World Health Organisation lists six neglected tropical diseases, five of which are caused by parasites. But parasites are by no means confined to the tropics as, for example, leishmaniasis and cystic hydatid disease are both endemic to Europe and result in significant morbidity there. Thus, specialists in clinical microbiology and infectious diseases, wherever they work, need a sound working knowledge of clinical parasitology. In 2007, ESCMID formed the ESCMID Study Group for Clinical Parasitology (ESGCP) in order to improve awareness, research and teaching in this sub-speciality.

This presentation will discuss current issues in the diagnosis and management of cutaneous leishmaniasis, schistosomiasis, strongyloidiasis and cystic hydatid disease as seen in clinical and laboratory practice in Europe.
