

COMBACTE CLIN-Net

A clinical research network to increase the efficiency of antimicrobial drug development in Europe

COMBACTE CLIN-Net

COMBACTE CLIN-Net is a pan-European clinical research network dedicated to performing high quality clinical studies to support the development of new medicinal drugs against multi-resistant bacteria. CLIN-Net was formed in January 2013, and started as a consortium of European hospitals and academic networks dedicated to clinical research in the field of infectious diseases. This collaboration was initiated by the Innovative Medicines Initiative of the European Commission, as a part of its New Drugs for Bad Bugs program.

Currently, >900 hospitals throughout Europe are members of this clinical research network. Although CLIN-Net is still building its definitive structure, the network is already involved in 16 epidemiological studies and Phase II and III clinical trials. Of these 16 studies and trials some are still in early preparatory phases and others are recruiting patients. These studies and trials include investigator-initiated studies, trials funded by public-private funds and trials that are funded fully commercially. Several new studies and trials are planned to start in 2019.

In each of the affiliated countries, coordination occurs through a national coordinator or national coordinating team. Many of these experts are members of established networks of experienced centres specialized in infectious diseases and/or intensive care units. To join CLIN-Net, hospitals are encouraged and expected to be committed to perform high standard clinical research according to GCP in the area of infectious disease and antimicrobial resistance.

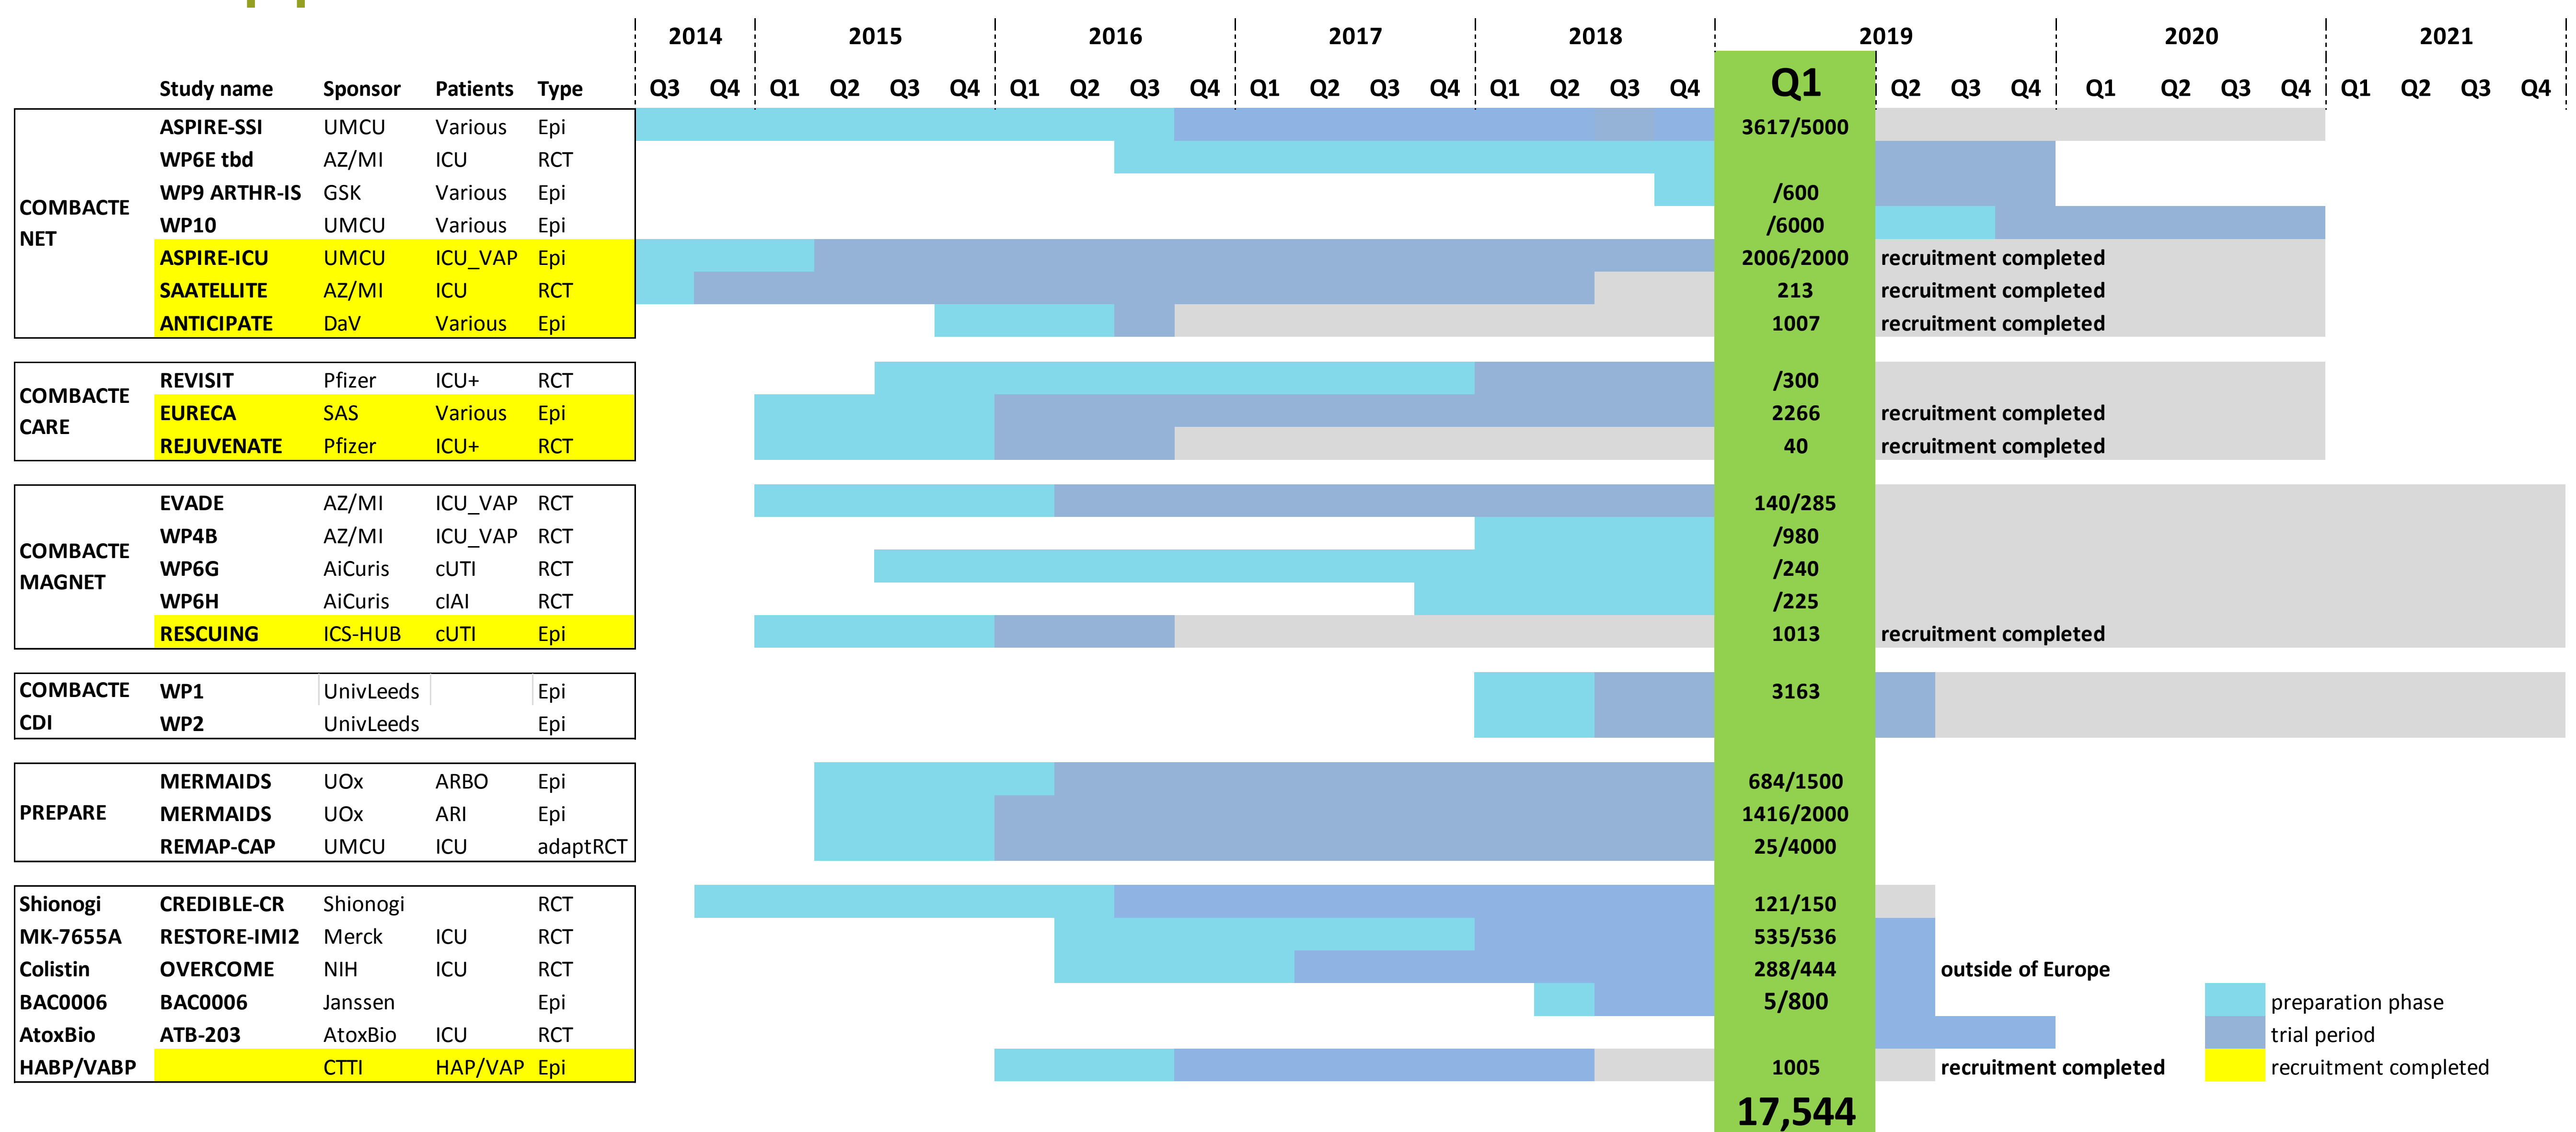

OBJECTIVES CLIN-Net

1. To develop and maintain a self-sustaining premier clinical research infrastructure in the field of infectious diseases in Europe
2. To increase the efficiency of antimicrobial drug development by facilitating and supporting the planning and execution of high-quality clinical trials
